

AI Engineer with 4.5+ years of ML experience, solving applied business problems at Russia's top banks, and conducting AI research at Tsinghua University. Specializing in LLM Agents and applications, end-to-end ML pipelines, and finance domain AI

EXPERIENCE

Sberbank - AI Engineer (Multi-Agent Systems & NLP) Oct 2025 — Present

- Engineered a multi-agent system (SGR, structured output, supervisor-executor) that assists project leaders in decomposing projects into actionable tasks while proactively identifying risks and recommending mitigation guidelines
- Developed an asynchronous multi-agent system that delivers *unbiased product analysis days faster than human experts*
- Designed an LLM-based pipeline (LangChain, function calling) that provides teams with best practice recommendations to enhance operational efficiency. *Expected outcome: average 10% reduction in lead time*

Tsinghua University - AI-Researcher (Multimodal AI & Multi-Agent Systems) Aug 2024 — Oct 2025

- Enhanced the robustness and efficiency of multimodal information processing systems (~2.7% increase in accuracy) by integrating advanced DL-based pipelines (weighted fusion networks, modality reconstruction, Swin, Wav2vec, BERT)

- Built and deployed an MVP of a multi-agent system (AutoGen, FastAPI, Docker) for the repository documentation generation

VTB Bank - ML Engineer (NLP & Time Series Analysis) Sep 2023 — Aug 2024

- Developed a pipeline for clustering (BERT, TF-IDF, SVD, K-Means) and hierarchical classification (LightGBM) of text requests received by technical support. The approach *reduces the average processing time of a request by ~25%*
- Built a time-series anomaly detection method (isolation forest, Prophet, volatility analysis). Deployed the pipeline (Airflow, Docker, PostgreSQL), enabling proactive identification of information system issues *hours ahead of human monitoring*
- Created a time series classifier (50+ feature generation, LightGBM) and integrated it with forecasting and anomaly detection tasks

Sberbank - Data Scientist (Classic ML & Recommender Systems) Mar 2022 — Sep 2023

- Fully responsible for 15+ ad hoc projects for multi-format retail businesses, forecasting existing store performance and ranking profitable expansion locations (PySpark, CatBoost, linear regression, spatial machine learning and feature engineering)
- Implemented a demand forecasting system (CatBoost, Prophet, Hyperopt) for sausage factory products. The pipeline estimates the volume of production and supply of goods, *enhancing the supply volume efficiency by ~20%*
- Analyzed the pairwise interactions of grocery products, and proposed a new approach to personalize recommendations

SKILLS

- AI Expertise:** Multi-Agent Systems, LLM Applications, NLP, Agentic RAG, Fine-Tuning (Vanilla, LoRA), Multimodal AI, End-to-End ML Systems, MLOps, Time Series Analysis (Forecasting, Anomaly Detection), Classic ML, AI in Finance, Ranking, Econometrics
- Tools & Frameworks:** Python, PyTorch, Hugging Face Transformers, LangChain, LangGraph, AutoGen, Claude, scikit-learn, CatBoost, LightGBM, FastAPI, Docker, Kubernetes, Airflow, PostgreSQL, PySpark, Git, SQL, Bash, asyncio, multithreading
- Communication:** English (fluent), Russian (native), Chinese (beginner)

RESEARCH & PROJECTS

Research

- Author of the [WWW paper](#) on a [fine-tuned open-source LLM](#) for reliability scoring of web content
- Built an open-source Multi-Agent System that improves accessibility via context-aware modality conversions ([paper](#))
- Author of the [Springer book chapter](#) on AI in network devices for efficiency, latency, and topology optimization
- [Speaker](#) at the [ODS AI](#) conference. Topic: Anomaly Scoring for Preventive Detection of Failures in Information Systems

Pet Projects

- Studied and applied modern NLP architectures and tooling: vectorizers (TF-IDF, fastText) for text clustering, transformer-based models (BERT, GPT) fine-tuning (vanilla, LoRA) for medical data, prompt engineering (few-shot, CoT, SGR)
- Took part in a Kaggle Clicks prediction competition (Vowpal Wabbit, PySpark). Ranked top 10%
- Applied machine learning methods to optimize the option price modeling and avoid the Black-Scholes model limitations

EDUCATION

Tsinghua University - Master's in Computer Science Sep 2024 - Jun 2026

- Relevant courses: NLP, Information Retrieval and Recommender Systems, Time Series Intelligence, Machine Learning, Reading and Writing Technical Papers, Combinatorics and Algorithms, Computer Networks, Chinese

HSE University - Bachelor of Economics (Machine Learning & AI in Finance) Sep 2020 - Jun 2024

- Teaching assistant for the Machine Learning in Macroeconomics course for graduate students
- Researcher at the Laboratory of Stochastic Analysis and its Applications. Topics: option price modeling using AI, neural networks
- Relevant courses: Deep Learning, NLP, Large-Scale Machine Learning, Machine Learning 1, Machine Learning 2, Data Analysis in Python, Probability Theory and Statistics, Stochastic Models, Econometrics, Financial Economics, Financial Markets
